# Safari SURVIVOR

Can you outwit your opponent with multiplication in a struggle to survive?

Object: To be the player with the most array cards after a specified length of time.

Number of players: 2

Materials: Multiplication array cards (55 of them), clock, blank paper to keep score (optional)

How to Play: Players pre-determine a length of time to play. Players then turn their backs to each other and shuffle their array cards. Place them in a stack face-up and turn back around to meet your opponent. At the same time, players place their TOP array card in the center. The player with the bigger array card (largest product or number of square units) wins the two cards. Play continues for the time determined ahead of time. The player with the most array cards at the end of the time wins. If a player loses all of his or her cards before the time allotted, the other player automatically wins. If multiple games are played, score can be kept by tallying up the number of array cards in your hand at the end of the game.
